

Responsible AI Framework for Resume Job Matching

Phase 1: Planning – Building a Fair and Ethical Start

Step	What We Do (Simple Language)	Why It Matters (The Benefit)
1.1 Define Fair Rules	We start with a formal list for each role, agreed upon by HR, managers, and D&I, to ensure the AI only looks at job-related information (skills, experience) and ignores personal factors like age or gender.	Clear Boundaries: Guarantees every candidate is assessed only on their ability to do the job, preventing unlawful discrimination.
1.2 Plan to Remove Old Bias	Before building the AI, we audit our historical hiring data to find any unfair patterns from the past. We create a detailed plan on how the AI will actively correct and avoid these biases.	Fair Training: Ensures the AI learns from a corrected and balanced history, not a biased one.
1.3 Define Human Roles	We create a clear chart that spells out exactly who is Responsible, Accountable, Consulted, or Informed for every decision the AI touches.	Zero Confusion: Ensures all recruiters, managers, and D&I staff know their exact role and who has final accountability.
1.4 Inform and Get Consent	Candidates receive a simple notice at the start of the application. It explains that AI is used, what criteria it uses, and what	Builds Trust: Provides transparency and complies with data privacy laws, empowering candidates.

	their rights are (e.g., to appeal). Provide transparency per GDPR Article 13 and ensure lawful basis (typically legitimate interest or consent)	
--	---	--

Phase 2: Building – Creating a Trustworthy and Explainable AI

Step	What We Do (Simple Language)	The Trust Check
2.1 validate data quality and fairness metrics against internal thresholds.	The AI system cannot move to final testing until the Data Science team formally confirms that the training data is balanced, complete, and meets fairness standards.	Quality Control: Stops any potentially flawed data from causing problems later on.
2.2 Design for Clarity	The model is built to not be a "black box." It must provide simple, visual explanations that show a recruiter why a candidate received a score (e.g., "High match due to Python and AWS experience").	No Guesswork: Allows recruiters to quickly understand and validate the AI's reasoning.
2.3 Stress Test for Weaknesses	We conduct rigorous testing, including "Red Team" exercises where dedicated testers actively try to trick the system (e.g., by stuffing a resume with	System Resilience: Confirms the AI is robust and continues to make fair decisions even under pressure.

	unrelated keywords) to see if it makes unfair or incorrect decisions.	
--	---	--

Phase 3: Launch – Working Together with Human Partnership

Step	The Process (Simple Language)	The Fairness Safeguard
3.1 Set a Caution Level	The AI only gives a definite rating ("Strong Match" or "Strong Reject") when it is highly confident. If it's less sure, the candidate is automatically flagged for mandatory human review .	Focuses Human Attention: Reserves human time for critical or ambiguous cases, minimizing the risk of the AI wrongly excluding a good candidate.
3.2 Require Dual Approval	If the AI recommends a "Strong Reject" for a candidate, the decision must be reviewed and approved by both the Hiring Manager and the Diversity & Inclusion lead .	Shared Responsibility: Ensures no single point of failure and adds a critical D&I check before a candidate is turned away.
3.3 Log Every Override	When a human recruiter decides to go against the AI's recommendation (an 'override'), they must document the specific reason (e.g., "Overrode due to unique project not covered by keywords") in a structured format.	Auditable Accountability: Creates a clear, permanent record of decisions for future reviews and helps the AI learn from human insights.

Phase 4: Long-Term Monitoring – Keeping the System Safe and Successful Over Time

Step	What We Monitor (Simple Language)	The Outcome
4.1 Automated Fairness Checks	We run periodic automated checks to see if the job market is shifting (e.g., new types of resumes) or if the AI's fairness metrics have dropped for any demographic group. An alert is automatically sent if issues arise.	Sustains Fairness: Catches problems quickly, allowing the team to address new biases before they impact candidates.
4.2 Continuous Learning from Humans	We regularly review all the documented human overrides (from 3.3). These overrides are categorized to guide the data science team on how to improve the AI model.	System Improvement: The AI consistently gets smarter by learning where human judgment adds value.
4.3 Monitor Business Success	We use a simple dashboard to track business impact, including average Time-to-Hire for AI-filtered candidates, and the Quality-of-Hire (e.g., 6-month retention rate). We specifically track the success rate of candidates who were flagged by the AI but saved by a human	Proves Value & Optimizes Workflow: Demonstrates the return on investment of the AI and helps optimize the balance between AI speed and human judgment.

	override.	
4.4 Candidate Appeals Process	We provide an easy-to-access " Appeal & Inquiry Form " in all communications, guaranteeing a human will review the candidate's application and respond within a set timeframe.	Ethical Safety Valve: Empowers candidates and ensures a human can always step in to correct an error.
4.5 Privacy by Design	We have a secure and verifiable process to completely delete a candidate's information from all systems upon their request, where legally required (known as the 'Right to Be Forgotten').	Data Protection: Upholds strict privacy standards and legal requirements.
4.6 Independent Governance	We have established a high-level, cross-functional AI Ethics Review Board . This Board has the explicit authority to pause the AI system and demand an external audit if a serious failure or bias is detected.	Institutional Accountability: Provides the highest level of oversight and ensures the framework is a priority across the entire organization.
